

NOVEMBER

No sun – no moon!
No morn – no noon –
No dawn –
No sky – no earthly view –
No distance looking blue –
No road – no street – no ‘t’other side the way’ –
No end to any Row –
No indication where the Crescents go –
No top to any steeple –
No recognitions of familiar people –
No courtesies for showing ‘em –
No knowing ‘em!
No travelling at all – no locomotion,
No inkling of the way – no notion –
‘No go’ – by land or ocean –
No mail – no post –
No news from any foreign coast –
No park – no ring – no afternoon gentility –
No company – no nobility –
No warmth, no cheerfulness, no healthful ease,
No comfortable feel in any member –
No shade, no shine, no butterflies, no bees,
No fruits, no flowers, no leaves, no birds,
November!!

“Yes, we all know that November is a dreich month. But ‘twas ever so, if **Thomas Hood** is to be believed!

Londoner Hood (1799-1845) was an editor of literary magazines, a poet, and a friend of fellow creative figures such as Charles Lamb and William Hazlitt. Writing in an age before central heating, electric light, and the internet, his lamentations about the privations of November must put our everyday grumblings in perspective.”

A Mystery to Solve

Can you help?

On the edge of our eastern boundary stream are three young beech trees. I say young because beeches can have a life span of 350 years.

They were all planted at the same time and the biggest of the three, the blond on the right, bigger maybe because it has more room to grow, is about 22½ years old.

Jill Laidler told me that she was walking her labrador, Barney, so about 20 years ago, round the field. She came across three saplings about 2 ft tall in amongst the nettles which grew in plenty along the wide field edges, when she met two women. One of them explained that her husband had planted the beeches in honour of his three granddaughters – two blond and one dark-haired. As far as I can tell the tree in the middle is a copper beech and the others are ordinary beeches.

Does anyone know more details about the trees? Were the family from Risinghurst or Sandhills? Are the granddaughters still living in the area?

If you can help please ring or email us 07799246929 middlefielders@hotmail.com

And Other Things

Fungi

There are approximately 15,000 wild fungi in the UK so identification could be a problem to say the least. However, it's v important because there are several poisonous and deadly species!

This one, snapped by a volunteer, in the south-eastern corner, next to the horse field, of the woodland could be the *Clitocybe Geotropa* or Trooping funnel which can grow up to 20 cm in diameter. The largest of these is at least 10 cm.

The next 4 pictures are of fungi growing on the felled tree on the eastern woodland path – the one carved into a seat

They look like some kind of bracket fungus but which kind?

Where are our experts?
