

Wild Flowers

Flowers still in the hedges and edges in this month of September

Still around since the May poster

Daisy

Dandelion

Herb Robert

White Dead Nettle

And since the June and July posters

Great Willowherb

Common Knapweed

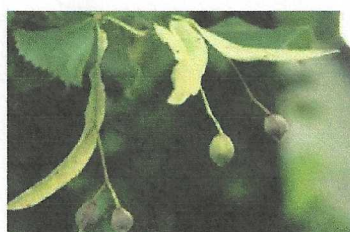

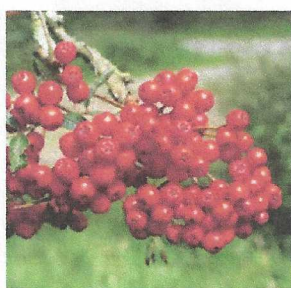

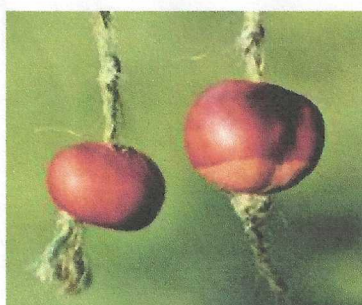

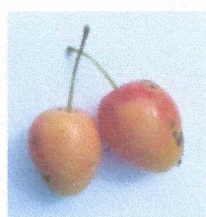

Yarrow

Trees

Fruits and seeds to identify??

Horse Chestnut	Sycamore	Crab Apple	
English Oak	Beech	Ash	Elder
Hawthorn	Lime	Turkish Oak	
Flowering Cherry	Mountain Ash		

And Other Things

Fungi

What's this one behind the pavilion?

The dry weather causing splits making them look like badly iced buns?

And close by ...

Inocybe rimosa? Torn fibre-cap?

Inocybe rimosa occurs under broad-leaf trees, in summer and autumn. This fungus contains the dangerous poison muscarine, and so it must be avoided at all costs when gathering fungi to eat.

Inocybe is a difficult genus, with numerous 'little brown mushrooms' or 'LBMs' as they are

commonly called, that to the naked eye appear to be identical until they are examined under a microscope... and even then it is very difficult to separate many of them.
