

Solstice

Our longest night is nearly here over Friday, 21st to Saturday 22nd sometimes called Midwinter

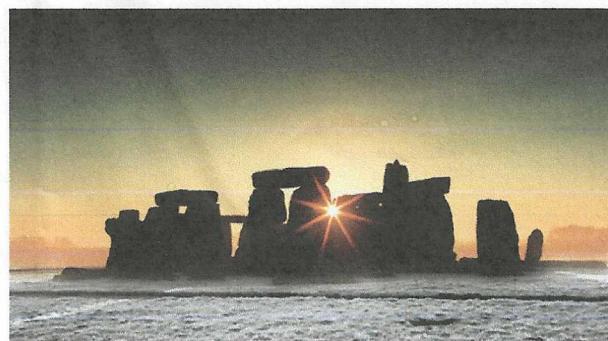

It's Winter Solstice (*Sol/Sun, Sistere/Stand still*) time when our day lasts only 7 hours and 46 minutes or thereabouts

Sunset at Stonehenge

This year, weather wise,
it might be possible
to see the sunset
just before
4 pm on Friday

but no way will we see the sunrise which is due at 8.10 am on Saturday. You might have noticed that viewing the sunrise from Risinghurst you have to wait more than 40 minutes till it's climbed up Shotover!

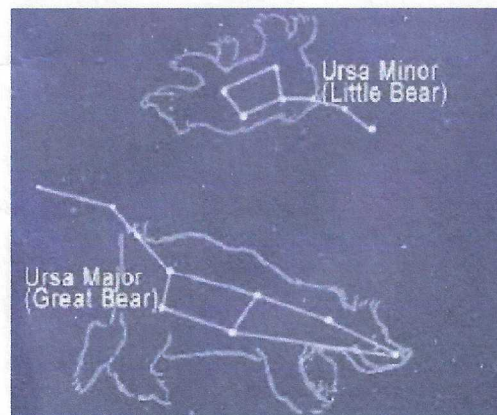

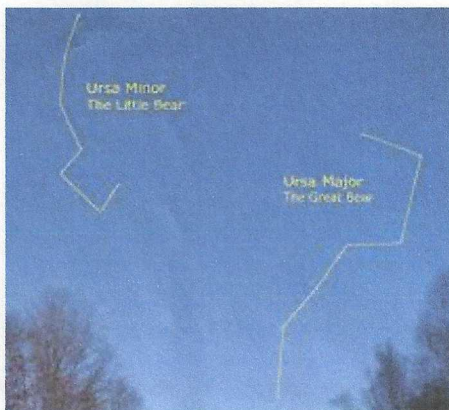

Sunrise on a frosty morning at Stonehenge

Solstice

Another thing to look out for is the Ursids Meteor Shower

Radiating from near Ursa Minor

You could see up to 10 meteors per hour. BUT there's a full moon which could make meteor spotting difficult.

Make the most of this Yule Moon though, the next one to occur during the Winter Solstice isn't till 2094. I must tell our great-grandsons to look out for it!
